Data Use Restrictions

Restriction label Health/Medical/Biomedical (Consent code: c1)

> Use of this data is limited to health/medical/biomedical purposes, does not include the study of population origins or ancestry. Data may not be used to investigate individual pedigree structures or individual participant genotypes for the purpose of identifying individuals or families; assess variables or proxies that could be considered as stigmatizing an individual or a group; perform phenotype-only analyses (note: investigators may request data for such phenotype-only analyses through the NHLBI's BioLINCC); or explore issues such as non-maternity and non-paternity and

perceptions of racial/ethnic identity. All research must be related to the etiology and prevention of morbidity and mortality of the U.S. Population consistent with the demographic distribution in MESA.

IRB approval required to use the data No

: The data table contains a mapping of subject ID to sample ID. Included are samples from MESA SHARe, CARe, and ESP HeartGO. Samples are the final preps submitted for genotyping, sequencing, or expression data. For example, if one patient (subject ID) gave one sample, and that sample was processed differently to generate 2 sequencing runs, there would be two rows, both using the same subject ID, but having 2 unique sample IDs. The data table also includes a mapping of sample

IDs to other sample ID aliases, the study/substudy (phs accession) that the sample belongs to, and sample use.

There are no overlaps in subjects in between MESA Classic Exam datasets, MESA Family Exam datasets, and MESA AIR Exam datasets. However, many of the phenotype measurements are shared between the MESA Classic and MESA Air Exams. Variables included in the MESA Air Exam are those from standard questionnaires, clinical and laboratory measurements. The questionnaires include variables of demography, socioeconomic and psychosocial status, medical and family history, medication use, dietary and alcohol intakes, smoking, and physical activity. The clinical measurements include anthropometry, blood pressure, ankle/brachial blood pressure indices, ECG, coronary calcium determination, arterial wave forms, and flow-dependent brachial artery vasodilation. Laboratory measurements include various lipids, cytokines, adhesion molecules, NO, and hemostasis/fibrinolysis markers.

: MESA Classic Exam 2 Main Dataset: The dataset for the second examination includes variables from selected questionnaires (including psychosocial measures of optimism, religiousness and spirituality, hostility, job stress, and quality of life), as well as repeated measures such as anthropometry, blood pressure and laboratory tests.

The Exam 2 dataset also includes additional phenotype measurements from an OGTT for all subjects, and a second coronary calcium CT for 50% of all subjects and

carotid MRI for 25% of all subjects. If the baseline findings from the subset of subjects indicated the presence of plaque, a further subset underwent a carotid ultrasound.

There are no overlaps in subjects in the MESA Classic Exam datasets and the MESA Family Exam datasets. However, many of the phenotype measurements are shared between the MESA Classic and MESA Family Exams. Variables included in the MESA Family Exam are those from standard questionnaires, clinical and laboratory measurements. The questionnaires include variables of demography, socioeconomic and psychosocial status, medical and family history, medication use, dietary and alcohol intakes, smoking, and physical activity. The clinical measurements include anthropometry, blood pressure, ankle/brachial blood pressure indices, ECG, coronary calcium determination, carotid ultrasound, arterial wave forms, flow-dependent brachial artery vasodilation, and cardiac MRI. Laboratory measurements include various

: MESA Air Exam 5 Dataset: MESA Air is an ancillary study of MESA. There are no overlaps in subjects in between MESA Classic Exam datasets, MESA Family Exam datasets, and MESA AIR Exam datasets. However, many of the phenotype measurements are shared between the MESA Classic and MESA Air Exams. Variables included in the MESA Air Exam are those from standard questionnaires, clinical and laboratory measurements. The questionnaires include variables of demography, socioeconomic and psychosocial status, medical and family history, medication use, dietary and alcohol intakes, smoking, cognitive function, erectile disfunction, and physical activity. The clinical measurements include anthropometry, blood pressure, ankle/brachial blood pressure indices, ECG, coronary calcium determination, arterial

wave forms, and corotid artery IMT. Laboratory measurements include various lipids, and urinary albumin and creatinine.

Samples are the final preps submitted for genotyping, sequencing, or expression data. For example, if one patient (subject ID) gave one sample, and that sample was processed differently to generate 2 sequencing runs, there would be two rows, both using the same subject ID, but having 2 unique sample IDs. : MESA Air Exam Main Dataset: The MESA Air Exam is an ancillary exam of the MESA Study. There are no overlaps in subjects in between MESA Classic Exam datasets, MESA Family Exam datasets, and MESA AIR Exam datasets. However, many of the phenotype measurements are shared between the MESA Classic and MESA Air Exams. Variables included in the MESA Air Exam are those from standard questionnaires, clinical and laboratory measurements. The questionnaires include

variables of demography, socioeconomic and psychosocial status, medical and family history, medication use, dietary and alcohol intakes, smoking, and physical activity. The clinical measurements include anthropometry, blood pressure, ankle/brachial blood pressure indices, ECG, coronary calcium determination, arterial wave forms, and flow-dependent brachial artery vasodilation. Laboratory measurements include various lipids, cytokines, adhesion molecules, NO, and hemostasis/fibrinolysis markers.

There are no overlaps in subjects in the MESA Classic Exam datasets and the MESA Family Exam datasets. However, many of the phenotype measurements are shared between the MESA Classic and MESA Family Exams. Variables included in the MESA Family Exam are those from standard questionnaires, clinical and laboratory measurements. The questionnaires include variables of demography, socioeconomic and psychosocial status, medical and family history, medication use, dietary and alcohol intakes, smoking, and physical activity. The clinical measurements include anthropometry, blood pressure, ankle/brachial blood pressure indices, ECG, coronary calcium determination, carotid ultrasound, arterial wave forms, flow-dependent brachial artery vasodilation, and cardiac MRI. Laboratory measurements include various

: MESA Air Exam 5 Dataset: MESA Air is an ancillary study of MESA. There are no overlaps in subjects in between MESA Classic Exam datasets, MESA Family Exam datasets, and MESA AIR Exam datasets. However, many of the phenotype measurements are shared between the MESA Classic and MESA Air Exams. Variables included in the MESA Air Exam are those from standard questionnaires, clinical and laboratory measurements. The questionnaires include variables of demography, socioeconomic and psychosocial status, medical and family history, medication use, dietary and alcohol intakes, smoking, cognitive function, erectile disfunction, and physical activity. The clinical measurements include anthropometry, blood pressure, ankle/brachial blood pressure indices, ECG, coronary calcium determination, arterial

wave forms, and corotid artery IMT. Laboratory measurements include various lipids, and urinary albumin and creatinine.

Data Use Restrictions

Restriction label Exchange Area (Consent code: c999)

> Data may not be used to investigate individual pedigree structures or individual participant genotypes for the purpose of identifying individuals or families; assess variables or proxies that could be considered as stigmatizing an individual or a group; perform phenotype-only analyses (note:

Full restriction text investigators may request data for such phenotype-only analyses through the NHLBI's BioLINCC); or explore issues such as non-maternity and non-paternity and perceptions of racial/ethnic identity. All research must be related to the etiology and prevention of morbidity and mortality of the U.S. Population consistent with the demographic distribution in MESA. The informed consent document

Multi-Ethnic Study of Atherosclerosis (MESA) Cohort

allows use of these data by investigators employed by non-profit and for-profit organizations. These data may be used by private companies in the development of diagnostics and therapeutics under the current consent. Pre-release exchange area for use by study investigators only.

IRB approval required to use the data

: The data table contains a mapping of subject ID to sample ID. Included are samples from MESA SHARe, CARe, and ESP HeartGO. Samples are the final preps submitted for genotyping, sequencing, or expression data. For example, if one patient (subject ID) gave one sample, and that sample was processed differently to generate 2 sequencing runs, there would be two rows, both using the same subject ID, but having 2 unique sample IDs. The data table also includes a mapping of sample

IDs to other sample ID aliases, the study/substudy (phs accession) that the sample belongs to, and sample use.
